

**FINAL PRESENTATION
PROFESSOR MASTERS
WEB DESIGN I**

EDISON VELANDIA

Challenges

1 One of the hardest things on this project was getting the photo grid on the home page to look exactly how I wanted it. I wanted two rows of two photos side by side, and then one photo centered by itself at the bottom. The problem I kept running into was that the images were all different sizes and proportions, so the grid kept looking uneven and some photos were taller, some were shorter, and the rows weren't lining up. Also, the fifth photo at the bottom of the home page gave me trouble for a while. I wanted it centered on its own row. I tried a few things that didn't work like using text-align center on the image directly, which didn't work. Then I tried setting the width to 100% which just made it the same as the others.

Solution:

I fixed the grid by setting a fixed height on every image 283 pixels as I had on my style guide and using object-fit: cover, which forces every image to fill that exact height without stretching. It crops from the center if it needs to, but everything stays uniform. Once I understood that, the grid finally clicked into place. As for the bottom photo what finally worked was giving it its own class called center-img, setting the width to 45% so it only takes up less than half the page, and then using margin: 0 auto which tells the browser to split the leftover space equally on both sides, I also set display: block in order for margin auto to work properly.

Challenges

2 The social media icons on the About page were frustrating because I previously downloaded four PNG files from different locations and when I put them on the page they were all showing at different sizes. I set width and height to the same number in CSS and they still looked uneven. That's because each PNG file had a different amount of built-in transparent space around the icon, so even though the boxes were the same size, the icons inside looked different.

Solution:

I fixed it by downloading all four icons from flaticon.com to make sure they were all the same size and adding `object-fit: contain` to the CSS, which makes each icon scale down to fit inside its box without cropping. That finally made them all look consistent. It taught me that when you download icons from different sources, they're not always built the same way internally even if they look similar.

Successes

1 Built fully clickable gallery cards by wrapping the image, title, and description inside a single anchor tag. Used `display: block` to make the entire card clickable and `text-decoration: none` to remove the default link underline. Set a fixed image height of 231px with `object-fit: cover` to keep every card uniform regardless of original photo size. I also used Bootstrap `col-4` for the top three cards and `justify-content-center` to center the bottom two.

2 Designed three navigation buttons: Previous, Gallery, and Next with a white background and black text that immediately stand out against the black page. Used the Poller One font with `letter-spacing: 2px` for a bold clean label style and `padding: 12px 20px` for a solid comfortable click area. Added a hover effect with `.nav-btn:hover` that flips the background to dark gray #333333 and the text to white, giving users clear visual feedback. I also Used `display: flex` with `justify-content: space-between` on the button container to naturally place Previous left, Gallery center, and Next right.

Changes Made Through HTML

Navigation Bar:

On my Midterm design the Navigation was made so that the logo was aligned left and the website title was centered, while the navigation links were centered below the website title. As I was working with HTML and CSS I discovered how to make a flex-box and I chose this approach because Bootstrap's navbar adds a lot of extra classes and a hamburger menu that I didn't need, and I wanted to keep the code simple and easy to explain. *display: flex; / align-items: center; / justify-content: space-between;*

Home Page Grid:

As mentioned and explained above I had some initial trouble setting up the first grid, which also made me realize the grid I presented on the Midterm was not aesthetically pleasing. While playing around with the grid I found the current grid set up to be the most effective. As for the gallery cards w3schools and getBootstrap helped me accomplish the result from the original design.

Color Pallett:

On the midterm design my color pallet was just black and white but while coding I decided to add different shades of gray to provide contrast. The following colors were used: #666666, #333333, #cccccc and #aaaaaa. On elements like borders and text these colors provide visibility and contrast when paired correctly, contributing to a clean, professional, and minimalist design layout.
